

Expression profiles of ProEx C and Ki67 in squamous cell carcinoma *in situ* of the skin and their relationship with human papillomavirus genotypes

Background: ProExC is a new marker for identification of precursor lesions of cervical carcinoma. Its utility in noncervical squamous cell carcinoma *in situ* (SCCIS) such as Bowen's disease (BD) and actinic keratosis (AK) where human papillomavirus (HPV) plays a role has not been elucidated. Our aim was to ascertain the immunohistochemical features and clinical utility of ProExC in SCCIS of the skin.
