Abstract: We describe a study on 38 children from 1 to 11 years of age, with anogenital warts, 25 were girls. The disease was primarily perianal. Sexual abuse was confirmed in one 9-year-old boy. Most responded to monotherapy with podophyllotoxin, imiquimod 5%, or cryotherapy in a 3-month follow-up period.

Key Words: genital warts, children, perianal, imiquimod, podophyllotoxin
